Date: 02/02/2021 13:07:34

Revision of the CO₂ emission standards for cars and vans

Fields marked with * are mandatory.	
-------------------------------------	--

Introduction

The European Green Deal, adopted by the Commission in December 2019, has tackling climate change and reaching the objectives of the Paris Agreement and other environmental issues (including addressing air pollution) at its core. One of its central elements is the 2050 climate neutrality objective, which the Commission proposed in 2018 and the European Council and Parliament endorsed (see European Council conclusions of 12 December 2019; European Parliament resolution of 14 March 2019; European Parliament resolution of 28 November 2019). The Commission has proposed to enshrine climate neutrality into EU law. In order to set the EU on a sustainable path to achieve climate neutrality by 2050, the Commission has also proposed a net EU-wide, economy-wide greenhouse gas emissions reduction target by 2030 compared to 1990 of at least 55% in its Communication on stepping up Europe's 2030 climate ambition.

Building on the existing 2030 legislation and the Communication on stepping up the EU's 2030 climate ambition, the Commission will review and propose to revise, where necessary, the key relevant legislation by June 2021. This will include a coherent set of changes to the existing 2030 climate, energy and transport framework, notably related to the EU Emissions Trading System Directive, the Effort Sharing Regulation and the Land Use, Land Use Change and Forestry Regulation, CO₂ Emissions Performance Standards for Cars and Vans, the Alternative Fuels Infrastructure Directive, the Renewable Energy Directive and the Energy Efficiency Directive.

Each sector must contribute to reaching the EU's climate objectives. Transport is the only sector whose greenhouse gas emissions are higher than in 1990 and where emissions are growing. Road transport, which today accounts for a fifth of the EU's greenhouse gas emissions and increased its emissions by over a quarter since 1990, has a key role to play. As highlighted in the European Green Deal, in order to contribute to the overall climate neutrality objective for 2050, emissions of the transport sector need to be reduced by 90% by 2050 compared to 1990.

The impact assessment accompanying the Communication on stepping up the EU's 2030 climate ambition prepares the ground for adapting climate and energy policies to help decarbonise the European economy. This initiative will look at strengthening the CO₂ standards for cars and vans, to ensure a clear pathway onwards towards zero-emission mobility. The current legislation sets reduction targets of 15% for cars and vans to be achieved from 2025, and of 37.5% for cars and 31% for vans to be achieved from 2030, all compared to 2021. In addition the regulation contains a mechanism aimed to incentivise the deployment of

zero and low emission vehicles.

This public consultation invites citizens and organisations to contribute in order for the Commission to be properly informed by public opinion in preparation for future legislative action on the $\rm CO_2$ standards for cars and vans. The results of the consultation will be summarised and published as well as be used to inform the Impact Assessment, accompanying the Commission proposal for revising the $\rm CO_2$ standards for cars and vans Regulation...

There are additional parallel public consultations on the review of the LULUCF Regulation, the Effort Sharing Regulation and the EU ETS Directive.

Guidance on the questionnaire

This public consultation consists of some introductory questions related to your profile, followed by a questionnaire. Please note that you are not obliged to respond to all questions in the questionnaire.

The Commission already held an open public consultation on increasing the 2030 climate ambition, which was open for 12 weeks from 31 March to 23 June 2020. Many high-level questions related to the increased climate ambition were asked in the context of that <u>consultation</u>. The present questionnaire therefore focuses on more specialised and detailed questions on the revision of the Regulation setting CO₂ Emissions Performance Standards for Cars and Vans in order to achieve the revised target.

At the end of the questionnaire, you are invited to provide any additional comments and to upload additional information, position papers or policy briefs that express the position or views of yourself or your organisation.

The results of the questionnaire as well as the uploaded position papers and policy briefs will be published online. Please read the specific privacy statement attached to this consultation informing on how personal data and contributions will be dealt with.

In the interest of transparency, if you are replying on behalf of an organisation, please register with the register of interest representatives if you have not already done so. Registering commits you to complying with a Code of Conduct. If you do not wish to register, your contribution will be treated and published together with those received from individuals.

Questions

A free text section is available at the end of some of the questions to enable you to provide additional clarifications or observations.

1. Objective

As highlighted in the European Green Deal, transport is the only sector whose greenhouse gas emissions are higher than in 1990 and where emissions are growing. Road transport accounts for around 20% of transport greenhouse gas emissions today. Road transport is also a key contributor to air pollution, especially in cities. In order to contribute to the overall climate neutrality objective for 2050, greenhouse gas emissions of the transport sector need to be reduced by 90% by 2050 compared to 1990. Transport also has to contribute to the overall emission reduction of at least 55% by 2030 as set out in the Commission Communication on stepping up the EU's 2030 climate ambition. CO_2 standards drive innovations in low and zero emission automotive technologies, which are of key importance for Europe's future industrial leadership. They make more low and zero emission vehicles and models available to consumers, which could have a positive impact on the price for such vehicles. Therefore, the Commission is working to revise the CO_2 standards for cars and vans set out in Regulation (EU) 2019/631, together with other relevant legislative measures to deliver on the increased climate ambition.

In your view, how important are the following objectives for the future cars and vans CO₂ legislation?

On a scale from 1-5, with 5 representing the highest importance and 1 no importance

	1	2	3	4	5
Reducing CO ₂ emissions from cars and vans to implement the overall emissions reduction target of at least 55% by 2030 and the climate neutrality objective by 2050	0	0	0	•	0
Promoting the market uptake of zero-emission vehicles and boosting their supply so that they become more affordable	0	0	0	•	0
Strengthening the competitiveness, industrial leadership, innovation and stimulate employment in the EU automotive value chain	0	0	0	0	•
Reducing total costs of ownership for consumers	0	0	0	•	0
Contributing to reducing air pollution	0	0	0	•	0
Reducing EU's energy consumption and import dependence	0	0	0	•	0

2. Future CO₂ emissions targets for cars and vans

Regulation (EU) 2019/631 currently sets the following new vehicle fleet average $\rm CO_2$ targets compared to 2021 levels: 15% reduction for both new cars and vans from 2025 on and 37.5% and 31% reduction for new cars and vans respectively from 2030 onwards. However, in light of the proposed increased ambition of the EU's greenhouse gas emission targets for 2030 and the objective of achieving climate neutrality by 2050, the Commission will revisit and strengthen the $\rm CO_2$ emission standards for cars and vans for 2030 as underlined in the Communication on stepping up the EU's 2030 climate ambition.

This section contains questions related to the future CO₂ emission target levels for cars and vans.

Target Levels

In your view, how important are the following actions related to the future CO_2 emission target levels for cars and vans to be presented in June 2021?

Scale from 1 to 5 where 5 is highest importance and 1 no importance

	1	2	3	4	5
Strengthening the 2025 CO ₂ emission targets for cars	•	0	0	0	0
Strengthening the 2025 CO ₂ emission targets for vans	•	0	0	0	0
Strengthening the 2030 CO ₂ emission targets for cars	0	•	0	0	0
Strengthening the 2030 CO ₂ emission targets for vans	0	•	0	0	0
Setting stricter CO ₂ emission targets for new cars and vans for 2035	0	0	0	0	0
Setting stricter CO ₂ emission targets for new cars and vans for 2040	0	0	•	0	0

The proposal for a European Climate Law, in line with the European Green Deal, set the objective of achieving climate neutrality by 2050. The Communication on stepping up the EU's 2030 climate ambition highlights that to achieve climate neutrality and ensure that sectors with emissions that are more difficult to abate have access to sufficient quantities of renewable and low carbon fuels, conventional cars will need to gradually be displaced by zero emissions vehicles.

In your view, in order to contribute to the climate neutrality by 2050 objective, by when should CO₂ standards become so strict that all new cars/vans are zero-emission vehicles?

	by 2035	by 2040	after 2040	The CO ₂ standards should not become so strict that all new vehicles are zero-emission
For cars	0	0	•	•
For vans	0	0	•	•

Do you have any additional comments on the levels of the future targets? If so, they can be added below:

1000 character(s) maximum

Road transport will play a relevant role in the achievement of 2030 target and contribute to the CO2 neutrality. However, appropriate investments in key sectors like infrastructure and networks of alternative fueling stations should be supported. At present it seems premature to foresee a stricter target for the post 2030 bearing in mind that a 2040 climate target will be defined and that detailed data on the zero emission vehicles uptake will be available.

The 2025 targets should not be changed since there is no lead-time for automotive industry to adapt the current productions which are expected to remain on the market in 2025. From a technical point of view, the regulation should respect the principle of technological neutrality, considering in an appropriate and complementary way to electrification a mechanism that takes into account the contribution of renewable and low-carbon fuels especially for the transitional period.

Timing of the targets

In the current Regulation, the same fleet targets apply for five years before becoming stricter. Other options could be considered to ensure an effective emission reduction trajectory.

Please indicate to what extent you agree with the following statements:

Scale from 1 to 5 where 5 is highest agreement and 1 is no agreement. Not all statements need to be rated.

	1	2	3	4	5
The same targets should remain applicable for 5 years before being strengthened, as in the current legislative framework	0	0	0	0	•
The targets should be strengthened every year.	•	0	0	0	0
In case targets become stricter more frequently, additional flexibility should be provided as regards annual compliance. For instance with banking and/or borrowing, so that overachievement in a given year can be carried over to subsequent years and/or underachievement in a given year can be compensated by overachievement in subsequent years.	0	0	0	0	•

3. Incentivising zero- and low-emission vehicles

The following questions relate to specific elements aimed to enhance the uptake of zero- and low-emission vehicles (ZLEV) such as plug-in hybrid vehicles, battery electric vehicles and fuel cell electric vehicles.

In addition to the binding CO_2 emission targets for manufacturers, Regulation (EU) 2019/631 contains a mechanism to incentivise the deployment of ZLEV, which are defined as vehicles with tailpipe CO_2 emissions between 0 and 50 g/km. A "one-way" crediting system is introduced from 2025 on. This means that the specific CO_2 emission target of a manufacturer will be relaxed if its share of ZLEV, expressed as a percentage of its total number of vehicles registered in a given year, exceeds the benchmarks set out in the Regulation. Exceeding the benchmark level by one percentage point will decrease the manufacturer's CO_2

target (in g CO₂/km) by one percent, and this target relaxation is capped at a maximum of 5%. Manufacturers who do not meet the ZLEV benchmark face no consequences.

For calculating the share of ZLEV in a manufacturer's fleet to be compared against the benchmark levels, an accounting rule applies, which gives a greater weight to ZLEV with lower emissions. In addition, during the period 2025 to 2030 and for cars only, a multiplier of 1.85 is applied for counting ZLEV registered in those Member States which had the lowest ZLEV share in 2017.

In order for the CO_2 emission targets legislation for cars and vans to contribute to the 2030 -55% target and the 2050 climate neutrality objective, it has to provide a strong incentive for the deployment of ZLEV. With this respect, different alternative options could be envisaged to incentivize ZLEV, as described below.

In your views, what are the main barriers for market uptake of zero-emission vehicles?

icles
i

- Price-quality ratio of key components like batteries
- Availability of recharging/refuelling infrastructure
- Limited range
- Availability of vehicles models
- Other...

Please specify:

1000 character(s) maximum

The market uptake of zero-emission vehicles is linked to the appropriate availability of re-charging and refueling points for vehicles powered by alternative fuels as well as to the need to make affordable the purchase of ZEV. It is necessary to continue and increase economic and tax relief measures to make new vehicles competitive with today's con-ventional vehicles and lower operational costs for the customer. Attention and specific supporting measures must be envisaged for commercial vehicles given their fundamental role played in the logistics and in the daily activities of SME.

For the period up to 2030

Please indicate to what extent you agree with the following statements on the incentive system for cars and vans:

Scale from 1 to 5 where 5 is highest agreement and 1 is no agreement.

	1	2	3	4	5
In addition to the CO ₂ targets, a mechanism incentivising zero- and low- emission vehicles should be maintained	0	0	0	0	•

Please indicate to what extent you agree with the following statements on the incentive system for cars and vans:

Vehicles eligible for the incentive system:

Scale from 1 to 5 where 5 is highest agreement and 1 is no agreement. Not all statements need to be rated.

	1	2	3	4	5
Only zero emission vehicles	0	•	0	0	0
All vehicles with emission below 50 g CO ₂ /km (as in the current Regulation)	0	0	0	0	•
Only vehicles with emissions below a lower threshold than 50 g $\mathrm{CO}_2\mathrm{/km}$	0	•	0	0	0
Other options	0	0	0	0	0

Please specify:

1000 character(s) maximum

ZLEV vehicles will substantially contribute to the achievement of the 2030 target. However, we have to consider an appropriate transitional period in order to develop the relevant infrastructure.

A revised threshold should be considered in the case of commercial vehicles, depending of their class and according to the available technologies for the specific class.

Incentive type:

Scale from 1 to 5 where 5 is highest agreement and 1 is no agreement. Not all statements need to be rated.

	1	2	3	4	5
The one-way crediting system should be maintained in its current form	0	0	0	•	0
The one-way crediting system should be replaced with an obligation for each manufacturer to register a certain share of ZLEV (i.e. mandate)	•	0	0	0	0
Other options	0	0	0	0	•

Please specify:

1000 character(s) maximum

For Small Volume Manufacturers, the multiplier should be enhanced (ZLEV should count more for Small Volume Manufacturers).

Link with the CO₂ target:

Scale from 1 to 5 where 5 is highest agreement and 1 is no agreement.

	1	2	3	4	5
The ZLEV benchmark/mandate levels should be adapted to the new targets. In particular, the benchmark levels should increase when targets levels are increased	0	•	0	0	0

For the period after 2030

Please indicate to what extent you agree with the following statements on the incentive system for cars and vans:

Scale from 1 to 5 where 5 is highest agreement and 1 is no agreement.

	1	2	3	4	5
In addition to the ${\rm CO}_2$ targets, a mechanism incentivising zero- and low-emission vehicles continues to be needed, even if ${\rm CO}_2$ targets become stricter	0	0	0	•	0

Please indicate to what extent you agree with the following statements on the incentive system for cars and vans:

Vehicles eligible for the incentive system:

Scale from 1 to 5 where 5 is highest agreement and 1 is no agreement. Not all statements need to be rated.

	1	2	3	4	5
Only zero emission vehicles	0	•	0	0	0
All vehicles with emission below 50 g CO ₂ /km (as in the current Regulation)	0	0	•	0	0
Only vehicles with emissions below a lower threshold than 50 g CO ₂ /km	0	•	0	0	0
Other options	0	0	0	0	0

Please specify:

1000 character(s) maximum

The current incentive and 'benchmark' mechanism for ZLEV (zero-and-low emission vehicles) foreseen by the current Regulation could be applied to any targets after 2030 depending on the market penetration data of such vehicles that will be available in next years.

A revised threshold should be considered in the case of commercial vehicles, depending of their class and according to the available technologies for the specific class.

Incentive type:

Scale from 1 to 5 where 5 is highest agreement and 1 is no agreement. Not all statements need to be rated

	1	2	3	4	5
The one-way crediting system should be maintained in its current form	0	0	0	•	0
The one-way crediting system should be replaced with an obligation for each manufacturer to register a certain share of ZLEV (i.e. mandate)	•	0	0	0	0
Other options	0	0	0	0	0

Link with the CO₂ target:

Scale from 1 to 5 where 5 is highest agreement and 1 is no agreement.

	1	2	3	4	5
The ZLEV benchmark/mandate level should be adapted to the new targets	0	0	•	0	0

Do you have any additional comment on the ZLEV incentive system? If so, they can be added below:

1	1000 character(s) maximum	

4. Contribution of renewable and low carbon fuels

Under Regulation (EU) 2019/631, compliance of a manufacturer with its specific emission target is assessed against the average CO₂ emissions of its fleet as measured under the WLTP.

Other EU policies incentivise the deployment of renewable and low carbon fuels in transport, as detailed in the Communication on stepping up the EU's 2030 climate ambition. They include for instance the Renewable Energy Directive, the Energy Taxation Directive, to be revised in June 2021, the upcoming specific initiatives promoting sustainable aviation and maritime fuels, a possible expanded emissions trading system.

Please indicate to what extent you agree with the following statements:

Scale from 1 to 5 where 5 is highest agreement and 1 is no agreement. Not all statements need to be rated.

	1	2	3	4	5
A mechanism should be introduced in the ${\rm CO}_2$ emission standards for cars and vans so that compliance assessment for each manufacturer takes into account the contribution of renewable and low carbon fuels.	0	0	0	0	•
The policies to decarbonize fuels and reduce emissions from cars and vans must remain in separate legal instruments	•	0	0	0	0

If a system to account for renewable and low carbon fuels is introduced when assessing compliance, please indicate to what extent you agree with the following statements:

1. With regards to the effects:

Scale from 1 to 5 where 5 is highest agreement and 1 is no agreement. Not all statements need to be rated.

	1	2	3	4	5
Such system will ensure a holistic approach to road transport decarbonisation	0	0	0	0	•
More renewable and low-carbon fuels will be made available for road transport	0	0	0	0	•

More renewable and low-carbon fuels in road transport will come at the expense of the availability of those fuels for other sectors/transport modes which face steeper challenges to decarbonize (e.g. aviation/maritime)	•	0	0	0	0
This will be incompatible with EU efforts to increase efficiency and reduce energy consumption	•	0	0	0	©
Such system will no longer ensure clear and distinct responsibilities and accountability for vehicles manufacturers and fuels suppliers	•	0	0	0	©
This could weaken the signal for innovations that are needed to make vehicles on the road zero-emission in time for the EU's 2050 climate neutrality	•	0	0	0	0
The CO ₂ emission standards for cars and vans should be tightened more rapidly in order to maintain the overall level of ambition	•	0	0	0	0
Air pollution co-benefits would not be achieved in the same degree	0	•	0	0	0

2. With regards to the design of the mechanism

Scale from 1 to 5 where 5 is highest agreement and 1 is no agreement. Not all statements need to be rated.

	1	2	3	4	5
Only renewable and low-carbon fuels actually used in cars and vans in a particular year should be taken into account to assess compliance with CO ₂ emission standards for these types of vehicles	0	0	•	0	0
To avoid double counting, renewable and low-carbon fuels should be counted either towards the targets set in fuels related legislation or to assess compliance under the CO ₂ emission standards for cars and vans	0	0	0	0	•
Renewable and low-carbon fuels should be counted according to their actual greenhouse gas emission savings over the whole lifecycle	0	0	0	•	0
All renewable and low-carbon fuels (such as sustainable biogas, biomethane and biofuels, renewable and low-carbon hydrogen or synthetic fuels) should be taken into account, as long as they meet the minimum sustainability criteria set under the Renewable Energy Directive	0	0	0	0	•
Only the renewable and low-carbon fuels with the highest greenhouse gas emission savings should be taken into account	0	•	0	0	0

Do you have any additional comments, views, information on the possible introduction of a system to account for renewable and low carbon fuels when assessing compliance with the vehicle ${\rm CO}_2$ standard? If so, they can be added below:

1000 character(s) maximum

The contribution to the reduction of CO2 emissions of vehicles powered by renewable fuels and low carbon content fuels could play a relevant role in the transitional period towards the complete electrification of

fleets. Taking into account the 'tank-to-wheel' approach, the Commission should develop an appropriate mechanism that considers the renewable dimension and the contribution of clean and sustainable fuels when determining the compliance of the manufacturer's average fleet emissions.

5. Allocation of the excess emissions premiums

Under Regulation (EU) 2019/631, manufacturers whose average specific emissions of $\rm CO_2$ exceed their specific targets should pay excess emission premiums, whose amounts is considered as revenue for the general budget of the Union, without a specific destination for the spending of the recovered money.

In your view, how should these excess emission premiums be allocated? They should continue to be considered as revenue for the general budget of the Union
They should be allocated to a new or existing specific fund or a relevant programme, with the objective to ensure a just transition towards a climate-neutral economy, in particular to support re-skilling, up-skilling and other skills training and reallocation of workers in the automotive sector Other
You can use the space below in case of additional views on the allocation of the
excess emission premiums:
1000 character(s) maximum

6. Other elements of the regulatory approach

Regulation (EU) 2019/631 includes a monitoring and reporting system and flexibilities allowing a more cost-effective implementation, such as the possibility for pooling, credits for the uptake of eco-innovations, an exemption for very small manufacturers, and a derogation possibility for small volume manufacturers.

In your opinion, do any of the following provisions need to be changed?

	Yes	No	Neutral
Monitoring and reporting provisions	•	0	0
Ecoinnovation	•	0	0
Pooling	•	0	0
Exemption for manufacturers registering less than 1,000 vehicles per year	0	0	0
Small Volume derogations	0	0	0

In your opinion, Are there other aspects of the Regulation that need to be addressed? If so, which ones?

1000 character(s) maximum

The current pooling provisions should be revised in order to allow broader options, especially with respect to the M1 and N1 segments. Banking and borrowing between cars and vans segments should be allowed.

7. Impacts

Do you agree with the following statements on the likely impacts of strengthened CO₂ standards for cars and vans?

Scale from 1 to 5 where 5 is highest agreement and 1 is no agreement. Not all statements need to be rated.

	1	2	3	4	5
The EU automotive industry will increase investments in zero- emission technologies	0	0	0	•	0
The competitiveness of the EU automotive industry on the global market will be increased	0	•	0	0	0
Lower income social groups will benefit from an economic perspective thanks to lower cost of ownership of a car (for example reduced upfront cost of EVs, reduced energy/fuel costs)	•	0	0	0	0
Macroeconomic benefits can be expected, on both GDP and jobs		0	0	0	0
Job losses in the automotive value chain can be expected as a result of decreasing production of conventional powertrains	0	0	0	0	•
New skills and qualifications for workers in the automotive value chain will be needed	0	0	0	•	0
Co-benefits in terms of better air quality, especially in urban areas, can be expected	0	0	0	• •	
Co-benefits in terms of energy dependency can be expected	0	0	0	0	0

Which other impacts are relevant in your opinion?

1000 character(s) maximum

Social and economic aspect should be carefully assessed on a MS level. Moreover, the impact on Small Volume Manufacturers should be considered.

What additional measures should be set up to ensure a socially acceptable and just transition towards zero-emission mobility, taking into account its social effects throughout the whole automotive value chain in particular in those regions particularly dependent on automotive jobs?

In general, we believe that the transition towards a zero-emission mobility has to be incentivized. However, in particular during the transitional period, the economic and the social impacts, in particular for employment and jobs in the automotive sector and related industries, should be deeply assessed. A Fund aimed at financing green industrial conversion investments for automotive and related industries manufactures and the related industries could be created, as the Innovation Fund established for the EU-ETS. The Fund could be financed also with the revenues of the penalties in case of non-compliance of manufactures.

8. Any additional comments

If you have any comments or supplementary information to add to your replies to the above questions:
